

## Port Access Charge (PAC)

---

Valid from 01. January 2019

---

Not for third parties

---

# 1 Notes on this Manual

---

## General

It is essential for the inclusion of a port in this manual as a rule that an Infrastructure Usage Agreement (IUA) has been concluded between DB Cargo and the port. The port receives the usage charge directly from DB Cargo, usually a charge per wagon. Settlement of accounts with the port is carried out by the Production Centre responsible.

The old Port Railway tariffs and the collection arrangements agreed with some ports (ports in the port charges manual) will no longer apply upon conclusion of the IUA. At the same time, the special arrangements in the old port charges (e.g. exemptions for maritime and export freight) also cease to apply.

Until the complete conversion of all ports, both manuals will apply in parallel. The inclusion of a port in this manual is always accompanied by the deletion of the same from the old manual, as long as it was listed there. This prevents double charging. In the Port Access Charges manual, charges will be included for ports which were not included in the old manual.

## Application

The port access charge (PAC) is a surcharge pursuant to clause 3.1.5 and 3.2.4 of the Prices and Services of DB Cargo AG and is raised in the ports listed via a code number in addition to the freight rate. In terms of the GLV-CIM handbook, the PAC belongs to the "charges directly related to the transport" (Appendix 3 "List of Charges", Clause 2, part A).

It applies per loaded wagon, not to empty wagons, nor to empty privately-owned wagons (exception: Port of Duisburg WRS). For the Port of Hamburg, the charge applies in single wagonload traffic (individual wagons or wagon groups) per loaded wagon, in trainload traffic per (loaded) trainload.

The inclusion of the surcharge in the freight rate is not permitted.

The port access charge also applies to loading points which are listed under the specified freight traffic locations.

It is settled using a special code number and does not include VAT.

For container traffic, a price per loading unit applies on principle. This applies to both loaded and empty containers.

For consignments between two freight traffic locations within a port, the PAC will be raised twice.

For consignments within a port (with a single freight traffic location no.), the PAC will be raised once (Locofreight).

## Note

If the infrastructure of a port can be used free of charge by DB Cargo and if also no other charges are payable to the port in this connection, no port access charge will be levied. Most of the time, the port settles the infrastructure charges in such cases bilaterally with the sender or consignee in the port. The port is shown in the list with an amount of "€ 0,-<sup>1</sup>".

If a port is served by a different or port railway undertaking and the latter settles the infrastructure costs bilaterally with the sender/consignee in the port, the port is shown in the list with an amount of "€ 0,-<sup>2</sup>".

If a port is served by a different RU on behalf of DB Cargo and the charge for use of the port infrastructure is an element of the charge for the service purchased, the PAC will not as a rule be shown separately. It is an element of the freight rate.

The port is shown in the list as follows: "incl."

If no wagonload or container traffic is operated in a port, the port is shown in the list as follows: "–". If such traffic is planned to be operated, please contact L.CSE for the calculation of the PAC.

The manual was introduced on 01.04.2006. It is continually updated.

Updates are marked in each case in the current edition in red.

As code numbers, please use nos. 272 (Consignment) und 273 (Reception).
